From social renting to housing independence – the social and economic impacts of housing tenure
The New Zealand Housing Foundation led the commissioning of this research in the interests of deepening and broadening the debate, decisions and action, relating to improving housing for all low and moderate income New Zealanders.

The objective of this report is to summarise new research findings and contribute to housing policy development by examining the costs, and benefits, of different forms of tenure and calculating the long term advantages of moving those in private and social renting on pathways towards home ownership.
Housing Foundation

The New Zealand Housing Foundation is a registered New Zealand Charitable Trust and Community Housing Provider.

- It exists to relieve poverty through the provision of affordable housing for low income households in New Zealand.
- It does this by delivering new, safe, stable, secure houses though its affordable rental and affordable equity products.
- It works with families to help them get their finances and other matters in order to set them up for successful tenancy and pathways towards partial or full home ownership and out of the rental poverty trap.
- To date Housing Foundation has built over 630 homes and housed households in 34 distinct communities.

The heart of the work that Housing Foundation does is underpinned by building sustainable, thriving communities where people are connected, mutually responsible and enjoy the benefits of improved quality of life.

The Research

This research was commissioned and funded by the New Zealand Housing Foundation with support from The Tindall Foundation. The FCSPRU (Family Centre Social Policy Research Unit), BERL (Business Economic Research Ltd) and NEXUS Research carried out these three independent research studies.

FCSPRU undertook a literature review which drew together more than 120 international studies that explored the associations between housing tenure and social, economic and health outcomes. In particular, the review highlighted the results of studies that measured the effects of housing tenure and security on health, employment, crime, welfare, wealth and education outcomes.

The second study involved BERL analysing the associations between housing tenure and fiscal costs for health, crime, welfare benefits and tax paid in New Zealand, using Statistics New Zealand’s Integrated Data Infrastructure (IDI).

Per capita costs for people residing in Auckland were estimated under the three tenure groups of social renting, renting, and owner-occupancy. These per capita costs were based on statistics including hospitalisations, corrections, benefits, and PAYE.

The third study by NEXUS Research was an independent survey of residents in a new community about their experiences of moving from predominantly rental circumstances through a range of rental and ownership tenure options, towards independent home ownership.

Overview

Strangely, a full discussion on the advantages of secure independent living and home ownership seldom features in the frequent reports of New Zealand’s housing dilemma, although its benefits are proven time and time again.

Home ownership for low and low-middle income households has simply not been a major focus of policy making in recent years.

From time to time, a few small schemes have been floated, but none of sufficient size to arrest the decrease in home ownership.

Housing tenure in New Zealand has undergone radical change in the last 26 years:

- Between 1991 and 2015, the proportion of households who owned their dwellings reduced from 74% to 64% and has continued to fall.
- Renters on the other hand, increased over the same period from 23% to 32% (Statistics New Zealand 2015) and continue to rise.
- More recently, the cost of housing has risen sharply, particularly in Auckland.

Housing policy is a difficult area for governments particularly because of high capital costs and steep market fluctuations.

As a consequence housing policy often takes the form of short term policies rather than a considered strategic response to the long-term requirements of housing security.

WORLDVIEW

The Global Housing Watch Survey (Ahir et. al. 2016), published by the International Monetary Fund (IMF), shows New Zealand had the second highest growth in house prices during 2015, and the highest price increases relative to income of any country. The reduction in home ownership and the increasing proportion of housing costs on household budgets has led to a growing number of reports of housing hardship and unaffordability (Boston and Chapple 2014, Child Poverty Monitor 2015, Perry, B. 2016). Housing insecurity is frequently reported in the New Zealand media and it has become the focus of considerable political attention.
**Study 01: FCSPRU**

This research looked at relevant international literature and the social and economic impacts of housing tenure.

**FINDINGS**

The research concludes that housing tenure is a significant factor for positive social and economic outcomes.

Home ownership, as opposed to renting, is often significantly associated with positive health, crime, and educational outcomes in studies, usually even after controlling for a range of variables including socio-economic status and income. This means that the findings pertaining to better outcomes as a result of greater security of tenure, either through rental or ownership, cannot simply be discounted on the basis of the wealth of the household.

The majority of studies find significant positive effects of home ownership under each of the six categories: health, employment, crime, welfare, wealth and education.

- Objectively assessed health conditions and self-assessed health status are improved in the areas of both physical and mental health.
- The labour market studies demonstrated the most varied results. Most studies though, show ownership to be beneficial, not only for protecting against unemployment, but also for faster exits out of unemployment when it occurs.
- There are fewer studies relating to crime, welfare and wealth, but the majority show home ownership is significantly associated with lower crime rates, less welfare dependency and offer a greater chance for low income families to create asset wealth, albeit at a lower rate than higher income groups.
- The children of homeowners also showed significantly higher educational attainment levels than those of renters in most of the educational studies.
- No studies demonstrated significantly negative health, crime, welfare or educational outcomes associated with home ownership. However, owners were found in a minority of studies to be less mobile and therefore less able to pick up jobs in non-local labour markets.

Many of the studies in the literature review came out of European countries where the tenancy protection laws are substantially stronger than those in New Zealand. This would suggest the negative effects of renting in New Zealand may well be under-estimated in the international literature.

**Study 02: BERL**

This research took the work of Study 01 and identified a relevant and applicable framework to apply to the New Zealand context using New Zealand data.

**FINDINGS**

Using Statistics New Zealand’s Integrated Data Infrastructure data over the four-year period July 2011 to June 2015, the study of fiscal costs, found that per capita costs to government of corrections, health (hospitalisations) and benefit payments were higher for renters than homeowners.

In addition renters paid less per capita PAYE revenue than homeowners. The modelled costs of:

- Transitioning 1,000 private renters to owner occupier status over fifteen years, made a potential net fiscal saving of $6.4 million.
- Transitioning 1,000 social renters made a net fiscal saving of $11.1 million.

BERL says that: “the results of this simple model strongly indicate that home ownership in New Zealand offers significant long term fiscal savings for government.”

These results were validated in a third study which is a survey of a broad range of families who are in the process of moving along the housing continuum from rental towards home ownership.

A key study in the literature review (Study 01) was replicated by BERL using the same New Zealand data sets, this time controlling for age, income, tenure and financial hardship. The simulation modelling supported the earlier results. They demonstrated the relationship between government expenditure on health and tenure type, and showed that owner-occupation yielded lower fiscal health costs compared to renters overall.

Together, all parts of the study on fiscal costs demonstrated the significant and worthwhile benefits to households and government of moving renters over time into owner occupancy.

**VALIDATION**

Housing Foundation’s on the ground New Zealand experience validates these research findings

Over the past ten years the Housing Foundation has housed hundreds of families, in 34 distinct communities, all across Aotearoa. During that time they have witnessed first-hand, significant positive changes to the lives and well-being of those people who bought/moved into new affordable houses.
I love knowing my neighbours and the sense of belonging that is here.
—Community Resident
The implications

Given the volatilities of the market, rapid housing price increases and declining home ownership since the 1990’s, more and more households are renting. As renters they are exposed to insecure unaffordable tenancies and will miss out on many of the positive attributes that affordable home ownership and secure tenure pathways will bring; such as more financial freedom, asset wealth creation, better health and education outcomes, improved community connectedness and social capital growth.

These three studies show that actively supporting the development of affordable home ownership and/or equity schemes that are made accessible to low and low-middle income families, produces benefits for households, for communities and for New Zealand.

Final words

This work is intended to support, deepen and broaden the debate relating to home ownership and the central role it plays in building better communities. We know that people who own things, especially their homes, even if it is a portion of the house on a pathway towards full ownership, feel and behave differently: no-one washes a rental car before they return it.

Households that are moving towards, or are in, home ownership tenure engage more in community, have stronger affiliations, different, and higher, expectations and better quality of life and outcomes. Moving people along the housing continuum, reduces the long term liability to the Crown, improves household outcomes, builds communities and is morally and fiscally the right course to take.

This research shows that market-tested, affordable rental, rent to buy and shared equity schemes are an important part of the solution to New Zealand’s housing crisis. These pathway products and services can provide greater security of tenure and deliver hope and an opportunity for families to lift themselves up, out of poverty, towards a better future.

My husband and I are the first of our generation to have the opportunity to own our own home.

— Waimahia Community Resident

It has given me and my family an investment for life.
